Wrist and hand masses account for 12.8% of soft tissue tumors. Wrist and hand masses can be benign (76.5%) or malignant (12.3%) or can be pseudomasses (11.2%). Clinical examination of the wrist, particularly palpation, can often reveal these swellings early and provide a straightforward diagnosis particularly in rheumatic disease, tenosynovitis or cysts.

Peripheral nerve blocks (PNBs) entail the injection of corticosteroids, local anesthetics, neurolytic agents and/or sclerosing agents into or near peripheral nerves or nerve ganglion resulting in the temporary interruption of conduction of impulses in peripheral nerves or nerve trunks (somatic and sympathetic nerves).
